

Project – Over Flow Car Park

Client - Manchester City FC Training Ground

Product – Park 40 Flip & Clip no dig solution

Quantity – 680M2

Project: The brief for this project was to introduce an overflow car park for the Manchester City training ground due to the lack of parking. The car park would be 680m2. They wanted a sustainable product that kept costs down and didn't need any planning permission and could be used immediately.

Solution: Our product Park-40 was perfect for the client, since our park range is designed for lighter duty installations and at a low-cost. Our park range allowed us to use our "Flip & Clip" system, with this no real preparation is required and eliminates the need for planning permission, this simply consists of turning the paver over and laying it on the grass as shown in the image. Once laying is complete we used a roller to press the pavers into the ground leaving the pavers standing 10mm above the surface to allow the grass to breath and aid growth.

Result: Once the grid was pushed into the ground the flip n clip process allowed a firm & stable grassed parking area that could support various types of traffic, the whole project was completed in less than a week and was able to use straight away.
