

Project – Leisure Centre

Location – Blackpool

Product – Gridforce GF40 Black

Quantity – 3800 m²

Project:

Blackpool Leisure Centre needed extra parking for their sports facility and events. They wished to turn their rough grassed area into a fully sustainable drainage system with a grass finish; utilizing Gridforce GF40 pavers.

Solution:

The land was prepared for laying the grid by removing excess dwarf walls and digging down to the substrate. Crushed brick from the walls was used as a drainage medium, which was then covered with 215m of MOT type 3 allow for adequate drainage. A sheet of geotextile membrane was laid on top of the MOT to prevent any further weed growth and act as a separating layer. This was then covered with a layer of 6mm grit providing a levelling layer and forming a bedding layer for the grid. The GF40 pavers were laid and connected into place to cover the required area. The grid was then in filled with topsoil and seeded. After some time, spent watering and re seeding the area the grass looked thick and full.

Result:

The installation work on this car park was carried out by Brennan Paving in November 2013, and within a short space of time the original waste land had been transformed and was available for use. The Gridforce ground reinforcement system allows vehicular stability, water infiltration and the reinforced grassed finish the customer required.
