

Project – Driveway

Location – Nottingham

Client – Private Client

Product – Gridforce GF40 Black

Quantity – 400m²

Project: Private customers wished to lay a new driveway to both their property and their neighbours in Nottingham. They wanted a gravel driveway, but were concerned about the movement of gravel when driving over it. They knew of Gridforce previously and contacted us to provide them and their contractor with the necessary information and technical support to complete the project. The driveway infill gravel had to complement the existing house.

Solution: The land was prepared for laying the grid by removing excess from the current surface down to substrate. MOT type 3 was then laid and compacted to provide a firm surface and allow for adequate drainage. A sheet of geotextile membrane was laid on top of the sub-base to prevent any further weed growth and act as a separating layer.

This was then covered with a layer of sand providing a levelling layer and forming a bedding layer for the grid. The GF40 pavers were laid and connected into place. The grid was then infilled with 10mm red angular gravel as selected by the client.

Result: The installation work on these driveways was carried out in September 2014 and within a short space of time the original driveways had been transformed and was available for use. The Gridforce ground reinforcement system allows vehicular stability, water infiltration and the reinforced gravelled finish the customer required.
