

Project – Car Park

Location – Blackpool

Client – Vets Practice

Product – Gridforce GF40 Black

Quantity – 450m²

Project: A brand new specialist veterinary practice in Blackpool wanted to create a parking facility for visitors. This was a new build and they wanted to create a car park that both enhanced the property and met current regulations for water run-off. The contractor did an exceptional job in creating this car park, both in its design and aesthetics.

Solution: The land was prepared by removing excess from the current grassed surface to allow for both the new practice and the car parking associated with this. MOT type 3 was laid and compacted to provide a firm surface that allows for adequate drainage. A layer of geotextile membrane was laid on top of the sub-base to prevent any further weed growth and to act as a separating layer. This was then covered with a bedding layer of grit sand and the GF40 pavers were laid and connected into place and parking bays were marked. The grid was then in filled with 10mm angular gravel as selected by the client.

Result: The installation work on this car park was carried out in July 2017 and within a short period of time the car park was available for use to coincide with the opening of the practice. The Gridforce ground reinforcement system allows vehicular stability, water infiltration and the reinforced gravelled finish the customer required.
